

Science Presentations

Basic Structure

- Introduction
 - Title slide. This should give the audience an idea of where the talk is going.
 - Introduce the topic (e.g. “stellar flares” or “titan and its atmosphere”) and explain basic concepts, background information
 - Tell the audience the problem. This should include both “big” and “small” picture questions. “We want to know {something} because it will help us understand {small picture} which is important because {big picture}”

Basic Structure

- Methodology
 - Talk about how you approached the problem and why
 - “To study {something} we use this {tool/ simulation/data} and then do {tests} to get the information we need”
 - Common Problem: DO NOT GO INTO TOO MUCH DETAIL. Generally one or two slides is enough.

Basic Structure

- Results
 - This is the bread and butter of your talk. Here is where you spend most of your time
 - FIGURES! People want to see plots or other figures that illustrate your results, **not text!**
 - Don't forget to keep bringing things back to your big and small questions.

Basic Structure

- Discussion
 - What are the implications of your findings? **Remember to connect it to the big picture!**
 - Talk about any errors/short comings of your methodology

What do you put on slides?

- **Titles!** These can help guide both you and your audience
- **Be Concise!** Each slide should have a single point that the audience should take away.
- **Figures!** Text is boring and people won't read it. One or two figures per slide. Make sure they are clear and readable!
- Limit the number of equations. Explain most things in words. Only use if they will add to or help your conceptual explanation
- Any text should be short and concise.

Misc. Presenting Tips

- Do not read from your slides!
- Talk with energy and authority. Do not be monotone. Keep up the momentum!
- Don't move around the room too much
- Use pointers. Do not try to point to things with your finger.
- Know your audience. Think about what you need to explain and what you can skip. Think about what people care about
- For plots: it might be a good idea to use text boxes to make axes labels, etc more readable. Make sure to thoroughly explain each plot. (“this is a plot of {...} vs {...}. It shows that {...} which implies {...}”)
- Practice Practice Practice!

Example: A Good Slide

A Universal Density Profile

Good Title that is information and also grabs the audience's attention

Log(density)

$\text{Log } \rho / 10^{10} \text{ M}_{\odot} \text{ kpc}^{-3}$

-4

-6

-8

low mass

high mass

3

$$\frac{c}{1 + r/r_s)^2}$$

Text boxes used to clarify where needed

Log(Radius)

Plot is large and readable

- The profiles follow the same functional form over four orders of magnitude in mass
- This implies self similar structure formation

Minimal text

Example: A Bad Slide

Results

Uninformative and boring title

Too Many Equations

of the
of the
radius for four dark matter halos of
different masses

Too many plots! And they are
way too small! No one can
read the axes

- Resolution is not a factor on the simulations. The top plot reveals that dark matter halos follow the same profile regardless of mass. Thus, this implies self-similar structure formation!!!

WAAAAY too much text

$$\frac{\rho(r)}{\rho_{crit}} = \frac{\delta_c}{(r/r_s)(1 + r/r_s)^3}$$

$$\delta_c = \frac{200}{c^3}$$
